

Martin Shaw

+44 7564 979 107

Full-Stack Web & Software Engineer

hello@martinshaw.co

Full-stack web, mobile and native app developer with 10 years of diverse experience in cloud hosting, e-commerce, financial services and network security. I am passionate about building complete solutions which combine feature-rich and high performance backends with frontend user experiences based in exceptional simplicity and user friendliness.

Wealth at Work - Senior Full-Stack Developer

March 2024 - Present

At Wealth at Work, I've had the opportunity to successfully manage the development of financial education projects for the first time. I am furthering my existing skills including Laravel, Vue.js and React Native while learning new skills including AWS services and project management with Jira and the effective delegation of well-defined tasks to other developers.

CodeAtlas.xyz - Creator

July 2022 - March 2024

Over a year and a half, I built an intelligent and powerful knowledge base for developers, during this period I improved my personal management, productivity and organisation skills enormously, this has definitely aided me in my future professional work.

Venditan E-commerce - Full-stack Developer

2020 - July 2022

I have worked across all departments for one of Europe's premier e-commerce platform providers for over two years.

I handled a combination of intense deadline-driven hourly-billed client work and the development of numerous highly-complex features in the agency's bespoke e-commerce platform focused on extensibility so that the client's chosen payment merchants, couriers and inventory types can integrate seamlessly.

I also managed the development and maintenance of a powerful barcode-scanning warehouse inventory & shipping management app and handled front-end development on multiple client store websites and mobile apps.

ANS Group (formerly UKFast) - Research & Development PHP Developer

March 2018 - August 2020

Responsible for developing new cloud hosting and networking features in existing products, building new APIs / SDK libraries & web apps for internal use, and resolving obscure bugs in complex codebases.

I was a major contributor to the ambitious mission to rewrite all existing projects (inc. MyUKFast, automation systems, data centre management tools) from old, monolithic and unwieldy PHP applications into modern, fully-tested, documented and CI/CD-deployed Laravel applications.
